

CASE REPORT: AMBLYOPIA

Girl age 14. 8 years age had measles and ever since had not been able to see with O.D.

Type S/P. Health good. Had been under treatment for three years with an oculist who was trying to make her see with right eye. Parents finally became disgusted with him and brought her to me. Examination revealed O.D. 20/400, O.S. 20/50-2 (with correction on both eyes). Syntonics suggested to parents. First six syntonizations brought O.D. to 20/70, much to my surprise. The new Rx was furnished. This was badly needed. The old one was about half the sphere and cylinder indicated.

Gave a total of twelve syntonizations of L- $\alpha\delta$ (Alpha Delta) followed by five syntonizations of L- μ (Mu). Case dismissed, and O.D. 20/30-3, O.S. 20/20 was the showing. A recheck four months later showed visual acuity the same than as when completed.
