

BLIND MAN

CASE HISTORY: 63 years old male was operated upon 2 years ago for cataracts in the left eye only. The operation was not successful and infection set in on the right eye which was also blind from cataract. The eye became very red and inflamed and gave constant pain. Surgeons felt that the removal of this eye was dangerous to his life in the condition it was so tried everything possible to relieve the inflammation and pain but with little or no success.

SYNTONIZATION: Although this man could not see light I gave him 10 treatments of μv with no nascentization and the pain is so much relieved that his wife brings him down to the office once or twice a week for a treatment and it looks as though I had a patient for the rest of his life. The eye is still inflamed and very red but the pain is so much less that the patient thinks I have done wonders.

I do not understand how this works but it did as the man was totally blind.

Submitted to the Oregon Academy of Syntonic Optometry on Aug 17, 1936.
