Optometrist
Room 15 Vogt Block
The Dalles, Oregon

November 14th

Case – Mrs. A. C. Thompson Age 78 years. Height 5 ft. 1 inch. Iris brown. Weight average 100 lbs., decided Asthenic type. Had no sickness other than colds for several years, no history of any wasting disease, diabetes or other trouble. Eyes began to fail and vision began to dim about 18 years ago. Had lenses and had them changed several times in last 25 years. Last time lenses changed 9 years ago at which time left eye practically blind but could still count fingers at 12 inches. Has 3 D of astigmatism as shown by Ophthalmometer and has had correcting lenses both for near and far.

Ophthalmoscope – Could not see fundus due to opacity of lens, no trouble externally all seemed normal. In looking at side no shadow thrown by iris, but could see a silvery white substance which seemed to be between lens and iris and to lay in folds.

Vision - 3/800 could not even see letters on 20/20 line at all, just saw a white spot.

Syntonics – 9 treatments with $\mu\nu$ – N/L Immediate improvement
5 x5 with $\mu\delta$ – N/L
2 L – $\alpha\delta$ complained could not see so good
8 with $\mu\nu$ continued improvement
1 with $\alpha\omega$ no good
1 with α no good'
8 with $\mu\nu S$ is improving all the time.

Vision now 20/20 also is now able to tell the time on her wrist watch and of course can see many other things. She had been so nearly blind for so long that she had forgotten many other letters and could not recognized them though she could see all the shape. She is learning to e\read the headlines in the paper now. Many of the lets she does not know what they are. Has forgotten them. Also used a few other filters but none gave good results.
