

BLEPHAROSASM – WITH Photophobia and low Ductions

CASE HISTORY: Mr. G. D. Age 18 High School student.
Complaint: Almost constant blinking and scowling for the last several months.
Very distinct discomfort from any bright light. Eyes feel weak to the extent that it is very difficult to study.

DESCRIPTION: Asthenic. Very nervous and fidgety.

VISUAL CONDITION: Acuity normal N.V. and with old Rx. Has Been wearing +.75 spheres O.U. for seven months. Examination shows +.75 correct but ductions very low as follows: Convergence 7/2; abduction 7/3; adductive tolerance 3/12/5; adductive neg. tol. 7/21/18. Stereopsis good.

SYNTONICATION: Six applications L $\alpha\omega$; then six times NL $\alpha\omega$ 1/1
v

RESULTS: Fair improvement in the Blepharospasm, Although it still bothers. Almost no Improvement in the photophobia and Absolutely no improvement in the low ductions.

Submitted to the Oregon Academy of Syntonic Optometry June 25, 1936.
