

## INFLAMATION

HISTORY: Case No. 4748; Housewife; Age 65.  
Patient came to me on July 7, 1936

COMPLAINT: Patient was struck four years ago at  
the articulation of frontal and right maxilar bones  
about the level with the eye. Lid was puffed and red.  
This swollen condition was permanent over the period of  
four years. She also complained of eye ball paining  
and of lid being stiff and heavy. She complained of  
a heavy feeling on the whole right side of face.

DESCRIPTION: Asthenic; medium height; medium fleshy.

## EXAMINATION

FINDINGS: She was wearing the perscription OU +1.50 for distance  
and OU +4.00 for reading.

VISUAL CONDITION: Acuity with old Rx. OD 20/25  
OS 20/25-

SYNTONIZATIONS: One L & syntonization was given each day for four days.

RESULTS: Noticed relief after first syntonization, eye ~~felt~~ felt  
lighter, and it did not pain so much. After each syn-  
tonization she noticed improvemant. At the end of the  
fourth syntonization redness and puffyness were gone and  
eyeball and lids were natural in appearance. Right side  
of face appeared like left side.

PRESCRIPTION: On July 13, 1936, the following Rx was  
given for distance OD +1.75 - .50 x 170, OS +1.25. This  
afforded an acuity of OD 20/20- OS 20/20.

Patient was dismissed with the happiness that the right  
eye felt normal again.

Submitted to the Oregon Academy of Syntonic Optometry on July 20, 1936.
